

Software Verification

Static Analysis Project

Karra Giovanni - 2169942

15 January 2026

Tools & Features

The software has been developped in pure **Rust**, using the [iced.rs](#) crate for the **GUI** part

It includes :

- DIY **syntax parsing** with helpful error messages
- **Modular generic architecture** allowing for easy implementations of more **abstract domains**
- Both a **graphical** and **command line** interface
- **Int_{m,n}** domain (and CLI only **Sign** domain)
- Configurable **widening** and **narrowing**

The **codebase** is available [here](#)

While language

```
e ::= x | n | e1 op e2 ∈ AExp
b ::= 1 | 0 | e1 == e2 | e1 < e2 | b1 & b2 | n!b ∈ BExp
S ::=
  x := e
  | skip
  | S1
  S2
  | if b then
    {
      S1
    }
    else
    {
      S1
    }
  | while b do
    {
      S
    }
  ∈ While
```

DEMO!

The widening operator is the standard interval one, and the narrowing operator is the glb
